2. As a relative concentration of solutes in two solutions increases, or necessarily the concentration of water in the same two solutions **INCREASES**. **Solution A** has a lower concentration of **SOLUTE** than does **Solution C**; **Solution A** is also hypertonic to **Solution C**.

3. If you wanted to make **Solution A isotonic to Solution B**, you could add water to **Solution B** or you could add solute to **Solution A**. If you took all three solutions, put them into a large container and mixed them thoroughly, then redistributed the solution among three containers, **Solution A** would be **ISOTONIC** to **Solution B**. **Solution A** would also be **ISOTONIC** to **Solution C**, and **Solution C** would be **ISOTONIC** to **Solution B**.

**Part III – Look at the solutions and cells illustrated above and fill in the blanks.**

1. Because the **cytoplasm**s of the plant and the animal cell have **equal** concentrations of solutes, we can say their cytoplasm are **ISOTONIC** to each other. If we put both the plant and the animal cells into **Solution A**, we would expect **no change** in the cells, because **Solution A** is **ISOTONIC** to the cytoplasm of each cell.
2. Let's put both cells into **Solution B**. Because **Solution B** is **hypertonic** to the cytoplasm of the cells, we would expect **water** to **LEAVE** the cells through the process of **OSMOSIS**. This would result in the cytoplasm of both cells shrinking.
3. Now we'll put both the plant and animal cell into **Solution C**, which, because it contains **no solutes** at all, is **HYPOTONIC** to the cytoplasm of both cells. **WATER** will enter both cells through **osmosis**. The **animal cell** is likely to **BURST**, unfortunately. The **plant cell**, however, is protected from this because of the presence of its **CELL WALL**.

Refer to the U-tube pictures above when answering the questions below.

1. Why did the number of water molecules on each side of the membrane change, whereas the number of sugar molecules stayed the same? **WATER MOLECULES ARE SMALL ENOUGH TO PASS THROUGH THE PORES OF THE MEMBRANE, HOWEVER, THE SUGAR MOLECULES ARE NOT.**
2. How does the plasma membrane of a cell compare with the membrane in the U-shaped tube? **THEY ARE BOTH SELECTIVELY PERMEABLE BASED ON SIZE OF PARTICLES**
